UNIVERSITY OF PRETORIA
DEPARTMENT OF CHEMICAL ENGINEERING
SPECIALISATION CSS420 (16 credits) (2018)

Fourth year students in the Department of Chemical Engineering who **comply** with the necessary **prerequisite**, namely **CPJ 421#, i.e. simultaneous registration for CPJ421**, may register for CSS420 Specialisation.

You register for CSS420 in the normal manner with Admin. (or have already registered). Note that, once you are registered for CSS420, you must get access to the relevant elective via **ClickUP**. Students must select **one** of the following elective options with regard to the second semester module Specialisation CSS420:

1. **Analytical Techniques** (Coordinator: Prof P Crouse) with contributions by guest lecturers
2. **Environmental Engineering** (Coordinator: Prof E Chirwa) assisted by Dr Tichapondwa & Dr D Brink
3. **Optimisation Techniques** (Coordinator: Mr C Sandrock) with contributions by guest lecturers
4. **Polymer Processing** (Coordinator: Prof W Focke) with contributions by guest lecturers

The undergraduate timetable for the second semester makes provision for meetings with the responsible lecturer on Mondays 11:30 – 13:20 and Wednesdays 11:30 – 13:20. Each lecturer will make his/her own arrangements with those students taking the relevant elective module with respect to utilisation of these lecture periods, as well as with regard to the venue where these meetings will take place. Students have to confirm the relevant arrangements with the respective coordinator. It is also necessary to ensure that students gain access to study guides and study material via ClickUP.

Note that the information in this document is also available on the Departmental Website at: http://www.up.ac.za/chemeng.

The information in the table below gives more detail with respect to the elective modules available in 2018. (The Department reserves the right to assign students to the other electives, in the case of one of the elective options not being available:

ELECTIVE	CONTENT
Analytical Techniques (Coordinator: Prof P Crouse)	Understand the different types of analytical techniques. Distinguish between numerous analytical techniques and their applications. Apply the theory to real analytical data. Techniques covered are: – Imaging (SEM, TEM, EDX/WDX, EELS, EBSD and FIB, confocal microscopy, optical microscopy, AFM) – Spectroscopy (FTIR, UV-Vis, Raman, etc.) – Chromatography (LC, GC, ICP, and the corresponding hyphenated techniques) – Thermal analysis (TG, DSC, DTA, DMA, Thermomat, etc.) – XRD, XRF, etc. – Miscellaneous (Particle size, density, porosity and BET surface area, rheology, etc.)
Environmental Engineering (Coordinator: Prof E Chirwa)	Environmental Systems, Drinking Water Treatment, Wastewater Treatment, Water Quality Parameters, Activated Sludge Process, Anaerobic Digestion, System Optimisation, Global Warming Mechanisms, GHG Emission Reduction The study objectives of this module are to: – provide information on the principles of Environmental Engineering/Management – provide an update of the legal framework for environmental systems – facilitate application of life cycle assessment principles – the “cradle to grave” approach – in human enterprises. – provide an overview of technologies for water and effluent treatment – introduce the student to the design of unit operation and unit process in environmental engineering, and – evaluate effect of pollution on receiving water bodies, and the effects in air and land.
Optimisation Techniques (Coordinator: Mr C Sandrock)	Understand the different types of optimization problems. Distinguish between algorithms to solve these optimization problems. Apply the theory to real optimization problems. – Theory of Convexity, Optimality conditions, One dimensional unconstrained optimization, – Multi-dimensional unconstrained optimization, Linear Programming, Non-Linear programming (NLP) with constraints, Integer and Mixed Integer Programming (IP and MIP) Textbook: Edgar, T.F., Himmelblau, D.M., Optimization of Chemical Processes, McGraw-Hill Chemical Engineering Series
Polymer Processing (Coordinator: Prof W Focke)	Unit processes in polymer processing. Analysis of complex processes: Description in terms of elementary processing steps. Transport phenomena: Transport equations, rheology and mixing processes. Elementary process steps: Particle technology, melting, pumping, pressure elevation, mixing, modelling of processes. Forming: Extrusion, calendering, injection moulding, and film blowing. Reactive processing: Thermo set materials, reaction kinetics.
