1. RESEARCH PHILOSOPHY

Through the growth of knowledge humankind has been transformed from primitive tribal societies to the information age. The purpose of research is to generate new knowledge. New knowledge not only enables us to better understand nature and our environment, including our interactions with others, but also enables us to better manipulate, use and manage the environment to our advantage. The purpose of the science of engineering and technology management is to provide us with the theoretical knowledge and practical techniques to better manage technology-based organisations.

Engineering and technology management links the engineering, science, and management disciplines. It provides an interface between technology and other corporate functions such as R&D, marketing, manufacturing and administration. It addresses the issues involved in the planning, development, and implementation of technological capabilities to shape and accomplish strategic and operational objectives of an organisation. It covers not only R&D management, but also the entire spectrum of managerial concerns in technology-based organisations. This includes issues relating to human resource management, innovation process management, project management, technological fusion, marketing, technological forecasting and strategic planning.

The Department’s research programme should be devoted to the improvement and further development of the theory and practice of engineering and technology management and should appeal to both academics and practising managers. Studies must be academically rigorous research of scholarly calibre that advance the science and practice of engineering and technology management.

Many research processes (designs) have been used successfully in the past in all areas of scientific endeavour. For a comprehensive review of many different research designs, see Mouton (2001:143). Many of these can and has been used in the field of engineering and technology management. The science of engineering and technology management is a practical “applied” science. It deals with the “real world” problems of managing technology-based organisations in a competitive global market. For this reason, there is a preference for certain types of research designs. There is for example a bias towards “applied” - empirical - type of research versus “basic” -philosophical and theoretical - investigations. As management is a predominantly behavioural science, there is also a

Research Philosophy
The balanced approach

- Theory
- Appealing to academics
- Basic research - philosophical and theoretical
- New theoretical knowledge and theories
- Practice
- Appealing to practising managers
- Applied research - observations and investigations of actual practice (empirical)
- New practical techniques, models & tools

Synthesis: Theory-based empirical research
preference for the approaches used in the human sciences rather than in the natural sciences. The predominant research designs in the natural sciences are laboratory and field experiments. These are less appropriate in engineering and technology management science as it is difficult to obtain the highly controlled conditions required for this type of research.

</tbody>
</table>

A common misconception amongst engineering and technology management students is that doing research is synonymous with doing a “management investigation”. This is not the case. A management investigation consists of the application of acquired knowledge to a specific management problem in an organisation, whereas research is the generation of new knowledge generalizable to other environments. The investigator's subjectivity is acceptable when performing a management investigation but research requires scientific objectivity. Insight and sound judgement are expected of a good management investigation, but research requires empirical proof. The outcome of a management investigation is mostly a company-confidential management report. Research is published in scientific journals.

Engineering and technology management science aims at understanding the processes involved in the management of technology-based organisations. The desired research output is new theoretical knowledge and practical techniques that can be applied by managers in their day-to-day management activities. What managers need are new and improved theories and models (tools) that can be applied in practice. Theories should be embodied in conceptual models (graphical, mathematical or schematic descriptions or analogies) or practical methods (procedures or techniques). These should however not only be of practical value, but should be based on observations and investigations of actual practice. As
already stated, this implies an empirical approach. Practical methods should however not only be based on observations but also have a sound theoretical basis. What is needed is theory-based empirical research. Research project should therefore contain elements of concrete experience, reflective observation, abstract notions and active experimentation as depicted in the research–application cycle. The types of research designs that are preferred are therefore theory-, model- or method-building, -testing and -application empirical research. (See Appendix 1 for a glossary of research terms.)

Studies must develop, test, or advance management theory and practice and should have well-articulated and strong theoretical foundations. All types of empirical methods - quantitative, qualitative, or combinations - are acceptable. Case studies and well-considered observations of management experience, survey research, methodological studies, replications and extensions of past research are acceptable providing it provides new conceptual or theoretical insights.

The application of existing theories, models and methods to routine management problems is management practice and cannot be considered as research. The ability to apply the acquired knowledge and skills is the most important outcome of the education process for managers. It is therefore required of management students to demonstrate their ability to apply their acquired knowledge and skills by conducting such management investigations. Such project assignments will result in “Management Reports” (“Guidelines for a Management Report 2002”, Graduate School of Management, University of Pretoria). To qualify as a research project, there must also be some generation of new knowledge. The application of existing theories, models and methods to a “new” problem or situation does generate new knowledge as it provides new insights and is a type of “theory-testing” research. This type of project is prescribed for MEM and MPM students. The instructions to the students state that although it “should demonstrate your understanding of the concepts … and your ability to apply them to a specific problem”; it is also “essential to produce something original and useful” (“MEM/MPM Research Project IGB 895/ISC 895, Instructions for Preparing a Research Project Report”).

There are therefore three possible aspects to a research project:
1) Application of existing theories, models and methods to a “new” problem.
2) Testing of existing theories, models and methods.
3) Building of new or improved theories, models and methods.
The emphases between these are different for a MBA/MEM/MPM Research Report, MOT Dissertation and a PhD Thesis. This is shown schematically in the following figure.
2. PROBLEM AREAS

The problem areas that are appropriate for studies in Engineering and Technology Management cover a wide spectrum. They can broadly be divided in three broad categories:

3. SUBJECT STRUCTURE

The subject structure is based on the contents of the Department’s programs. A list of subjects is attached as Appendix 2.

4. RESEARCH METHODOLOGY

Related research designs that can also be considered are statistical modeling and computer simulation studies (Mouton 2001:163), surveys (Mouton 2001:152), case studies (Mouton 2001:149), implementation (process) evaluation (Mouton 2001:158), field/natural experimental design (Mouton 2001:157) and experimental and quasi-exp. outcome studies (Mouton 2001:160). Although these could be complete studies in their own right, it is preferred that they be used as data-gathering and data-analysis techniques for theory-, model- or method-building, -testing and -application studies. Stand-alone literature reviews (Mouton 2001:179) will not be supported. Theory and research reviews should be an integral part of all studies, irrespective of the particular research designs used.

5. NATURE OF SUBJECT LITERATURE

Subject literature is mainly those contained in textbooks, articles in scientific journals, published conference proceedings and master’s dissertations/PhD theses. A list of key literature sources is attached as Appendix 3, but students must search beyond these.

6. RESEARCH MANAGEMENT PROCESS

To enable students to work in a systematic and orderly way, the research project is divided into the following five phases:

Phase 1 : Research Proposal
Phase 2 : Research Plan
Phase 3 : Research Execution
Phase 4 : Dissertation/thesis/report
Phase 5 : Examination and Dissemination

Each phase has a set of actions, an output, a review baseline and a milestone as shown in Appendix 4. This process is also shown as a flowchart in Appendix 4. At the conclusion of each phase the output documentation is submitted to the Study Leader or the Research Committee (in the case of M-dissertation and PhD students) for review and approval. Appendix 5 contains notes on the research
process, adapted from Malan, Coetzee & Van Breda (1992, P. 37). A typical schedule of milestones for a two-year research project is shown in Appendix 6. There are specific dates every year when dissertations/theses/reports must be submitted for examination. Research project schedules should keep these in mind (see Appendix 6 for details). Appendix 7 contains the Review Committee’s pro-forma Review Reports.

7. RESEARCH PROPOSAL

Research could mean, “to search again”\(^1\). This implies that there is a “first search”. This could be seen as the preliminary search that is done before a research proposal is submitted. The preliminary search should help you to focus your thoughts on a topic and the way you are going to approach and structure the work. Also, it will familiarize you with the relevant academic literature.

Here are a few useful points to keep in mind when doing the preliminary search:

- Be inclusive with your thinking and see how many different research projects you can identify.
- Try not to be overly influenced at this time. Search for something that you are really interested in.
- Keep in mind that first and foremost the whole research project should be a learning experience for you. The process of conducting the research may be just as important (or more important) than the outcomes of the research.
- Write down your ideas using the one-page format provided in Appendix 8. Discuss your ideas with friends, colleagues and potential study-leaders.

\(^1\) The English word “research” originates from the Old French re- + cerchier, meaning, “to search”. However, the prefix “re-”, coming from the Latin re-, means “again”. Research could therefore also have the meaning of “to search again”.

© Copyright University of Pretoria

Issue 22, 1 October 2014
Here’s a final check before you should start writing your proposal. Does each of these statements describe you?

- I am familiar with the theories and past research that has been conducted in areas related to my research project.
- I have a clear understanding of the steps that I will use in conducting my research.
- I feel that I have the ability to get through each of the steps necessary to complete my research project.
- I know that I am motivated and have the drive to get through all of the steps in the research project.
- I have found a study leader that is prepared to guide me through my research project.

Now you’re ready to write your research proposal. Here are some ideas to help with the task:

- Read through someone else's research proposal.
- Do a comprehensive theory and research review. The rationale behind the theory and research review is to make sure that this research is needed and the methodology is appropriate for the question that is being asked. The more general sources such as textbooks, course notes and overviews are more appropriate at this stage. You should consult at least the following number of literature sources:

<table>
<thead>
<tr>
<th>Source</th>
<th>Mem/MPM/MTM</th>
<th>Dissertation</th>
<th>PhD</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEM/MPM/MTM</td>
<td>5</td>
<td>10</td>
<td>20</td>
</tr>
</tbody>
</table>

(Practical advice: When you read something that is important to your study, capture the relevant article or section in your filing system, either as paper copies or in electronic format. Keep your copies organized according to categories and sections. And, most importantly, record the bibliographic citation so that you can easily reference the material in your bibliography. Then, when you decide to sit down and actually write the theory and research review, retrieve your copied records, arrange them into logical and sequential order, and then begin your writing. MS Word has a function that can be activated to record references as you write. The list of references can then be compiled later. The library also offers a course in Refworks to students.)

- A good proposal should begin with a statement of the problem/background information, then move on to a review of theory and past research, and conclude with a defining of the research methodology. Of course, it should be written in a future tense since it is a proposal.

---

**PLAGIARISM**

Plagiarism is committed when someone uses another person’s words, ideas or opinions without acknowledging them as being from that other person. Special care should be taken with information taken from web sites and other electronic sources. Transgression could result in expulsion from the University. See Appendix 13 for guidelines on how to avoid plagiarism.
• Focus your research very specifically. Don't try to have your research cover too broad an area.

• Include a title on your proposal. Preparing a good title means: having the most important words appear toward the beginning of your title, limiting the use of ambiguous or confusing words, breaking your title up into a title and subtitle when you have too many words, and including key words that will help researchers in the future find your work.

• It's important that your research proposal be organized around a set of questions that will guide your research. When selecting these guiding questions try to write them so that they frame your research and put it into perspective with other research. These questions must serve to establish the link between your research and other research that has preceded you. Your research questions should clearly show the relationship of your research to your field of study. Don't be carried away at this point and make your questions too narrow. You must start with broad relational questions.

A good question: "Are the technology management challenges faced by high-tech start-up firms in Pretoria similar to those faced by start-up firms in general?"

A poor question: "What are the technology management challenges faced by high-tech start-up firms in Pretoria?" (too narrow)

A poor question: "What are the technology management challenges faced by firm XYZ?" (not generalisable)

• Choose your methodology wisely. A well-designed quantitative research study can often be accomplished in very clear and direct ways. A similar study of a qualitative nature usually requires considerably more time and a tremendous burden to create new paths for analysis where previously no path had existed. Sometimes a combined methodology makes the most sense. You can combine a qualitative preliminary study (to define your population more clearly, to develop your instrumentation more specifically or to establish hypotheses for investigation) with a quantitative main study to yield a research project that works well.

Research proposals should be at least twenty typed pages (PhD candidates), ten typed pages (MOT students), or five typed pages (MEM/MPM/MBA students) in length.

The framework as described in the brochure Magister- en Doktorale Studie: Riglyne vir Studielejers, Promotors en Studente, obtainable from the Buro for Academic Support Services, may be used as a guideline for preparing the research proposal. Use formal South African English and the scientific style of writing (e.g. “It is proposed…” not “I propose …”). For guidelines on paragraphs, numbering, etc. consult the UP Guidelines for the Preparation of Written Assignments (http://www.up.ac.za/asservices/ais/assign.pdf.) and departmental procedure documents (See e.g., Appendix 14: Technical Editing). Make use of scientific research terms (See Appendix 1: Glossary of research terms).
The research proposal which is submitted prior to admission, must contain at least the following information:

**Title**

The proposed title should be one sentence, free from all elaboration and superfluous detail, which gives a clear, complete and formal description of the research project.

To ensure that the proposed topic/title in not a duplicate of previous or current research, a search has to be carried out on the Research Report database of the National Research Foundation.

To do the search, follow the instructions below:

- Go to the NRF nexus database website: http://stardata.nrf.ac.za/
- Click on Current and Completed Research Projects Database
- Use the following ID and password
  - ID: zup01 or zup02 to zup05
  - Password: up
- Search the database to ensure that the intended topic/title is not a duplicate of previous or current research.

**Table of contents**

Give a listing of the section headings with page numbers.

1. **Introduction and background**
   
   1.1 Describe and give an introductory overview of the technological, industrial and/or organisational context of the study.
   
   1.2 Indicate the proposed topic of the research – what is the broad issue to be investigated?
   
   1.3 Give reasons for selecting the particular problem - the rationale for the study.

2. **Theory and research review**
   
   2.1 Give a preliminary overview of the relevant theories properly referenced (see Appendix 11). What research has already been done on this topic or in this field, and what important findings have been made thus far?
   
   2.2 Describe and give a critical analysis the main theories, models and methods that currently exist.
   
   2.3 Indicate whether a need exists for a new or improved theory and identify the key attributes of the desired theory and derived models or methods.
3. **Problem Statement and Research Objective/s**

3.1 Formulate the proposed problem statement in one paragraph, free from all elaboration and superfluous detail

3.2 Give clear, complete and formal descriptions of the research question/s.

3.3 Describe the research objectives – what will be achieved?

3.4 Give clear, complete and formal descriptions of the research proposition/s or hypotheses. (See the framework provided on the next page.)

3.5 Indicate the relative weight of the following types of research that you propose to undertake:
   - Theory building research
   - Theory testing research
   - Theory application research

3.6 Indicate the importance of the problem – why should this particular problem be addressed?

3.7 Describe the limitations of the study and the assumptions on which the research will be based.

---

**FRAMEWORK FOR RESEARCH OBJECTIVES**

PROBLEM STATEMENT
What is the problem?

RESEARCH QUESTIONS
Considering the problem, what are the questions that has to be answered?

RESEARCH OBJECTIVES
What would you achieve by answering these questions?

RESEARCH PROPOSITIONS
Statements about the problem, offered for consideration or acceptance.

HYPOTHESES
Testable expectations about the research questions, logically derived from the propositions, theory and/or observations.

4. **Expected Contributions**

4.1 Describe the expected nature of the results.
4.2 What will the contribution(s) of the research results be? Describe the contributions towards scientific knowledge and what other values the research will have.

4.3 Who will benefit from the research?

5. **Research Strategy**

5.1 Present the proposed approach and strategy for performing the research.

5.2 Describe the method of study or research design and methodology to be followed.

5.3 Indicate the proposed research instrument(s) (questionnaire, case study, interview) and methods of data collection and analysis. Give some justification of why the methods are proposed.

5.4 Give a proposed project plan and schedule for performing the research.

6. **Ethics Committee Approval**

6.1 All research involving interaction with people must be submitted to the Ethics Committee of the Faculty for approval. The application form for approval must be attached to the research proposal. See appendix 15 or [http://www.up.ac.za/ebit/r_ethics.html](http://www.up.ac.za/ebit/r_ethics.html).

7. **Proposed Table of Contents of Thesis/Dissertation/Report**

Give a proposed chapter plan and a preliminary outline of the chapter divisions. The following is the basic structure for all theses/dissertations/reports:

- Preliminaries
- Chapter 1: Introduction/Background
- Chapter 2: Theory and research review/Theoretical background
- Chapter 3: Theoretical framework/Conceptual model or method
- Chapter 4: Research design and methodology
- Chapter 5: Results: Data gathered and analysis
- Chapter 6: Conclusions and recommendations
- List of references and appendices

8. **Conclusion**

A concluding statement on the feasibility of completing the study as proposed.

9. **References and preliminary bibliography**

8.1 List all the references that have been referred to, in the prescribed format (see Appendix 9:1 Policy, procedures and regulations and Appendix 11).

8.2 Give a preliminary bibliography listing the most important and recent specialist literature that has been consulted.

9. **Personal information**
Give the following information:

- Name and student number
- Postal address
- E-mail address and telephone number(s)
- Your complete academic record(s) as well as work history.
- A list of your previous research results, e.g. research reports, masters dissertation, publications, articles, conference papers, etc.
8. STRUCTURE OF DISSERTATIONS/THESES/REPORTS.

The dissertation/thesis/report is the final embodiment of your research project. It is a reconstruction and documentation of the logic of your research. The research logic for theory/model/method-building, -testing and -application empirical studies are shown as a flowchart in Appendix 10. In the rest of this discussion only the term “theory” will be used, but it could also mean any models or methods derived from or based on the theory.

The dissertation/thesis/report should start with the research problem, followed by the research design, the evidence and the conclusions. The reader should never be in doubt as to where you are in this process. You should indicate this clearly in introductory and closing paragraphs in each chapter. Here are some guidelines for the structure of the dissertation/thesis/report:

Preliminaries
The dissertation/thesis/report should start with a Title Page, Acknowledgements, Summary/Abstract, Table of Contents and List of tables/List of figures.

Chapter 1: Introduction/Background

Chapter 1 should contain background information regarding the technological, industrial and organisational setting for the study. It should describe and give a thorough overview of the historical development and current state of the industry, organisation/s and technology under investigation. It should present the reasons for selecting the particular problem - the rationale for the study - as well as a statement of the research problem (and/or research objectives or research question/s). You should identify the key attributes of the desired theory and derived models or methods that is required to solve the research problem. Your objective could read: “To [develop a new] or [test the] or [apply the] theory for …”. Your goal could be to show that the theory you have developed, tested or applied is valid and useful for solving the research problem (or answering the research question/s). See Mouton (2001:122) for detailed instructions on writing this chapter. Sub-headings for this chapter could be:

1.1 Introduction
1.2 Historical development and current state of the <industry, organisation/s and technology under investigation>
1.3 Research problem
1.4 Rationale for the study
1.5 Research objectives and/or research question/s
1.6 Key attributes of the desired theory and derived models or methods

Chapter 2: Theory and research review/Theoretical background

Chapter 2 should contain a comprehensive review and critical analysis of the theory and past research that represents the most authoritative scholarship in those fields related to the research problem. This should be a wide-ranging survey of the broad area of interest, including work in related fields. You should indicate
what research has been done and what theories currently exist and if any of them can or have been applied to the research problem. Don’t just list or describe what you have read, give a critical analysis of the theory and past research. You have to show whether a ‘gap’ exists for a new or improved theory that is specifically tailored to the research problem.

It is very important to revisit your literature review before you submit your final dissertation/thesis/report to check that there have not been new publications in your field of study. One of the most common criticisms from external examiners is: “The student ignored the following recent publications in this field: … ”

See Mouton (2001:123) for detailed instructions on writing this chapter. Subheadings for this chapter could be:

2.1 Theory and research review
2.2 Current theories
2.3 Need for a new or improved theory (optional for theory-building research)

Text references must give the author’s surname, year of publication and page reference. (See Appendix 11 for more detail.) For example:

“Landman (1998:12) points out that without a thorough literature study, on which adequate time has been spent, the research work in question can only be considered superficial and naive.”

OR

“Without a thorough literature study, on which adequate time has been spent, the research work in question can only be considered superficial and naive (Landman 1998:12).”

The reference number refers to Landman’s work as shown in the list of references at the end of the dissertation/thesis/report (see last item in this chapter).

Chapter 3: Theoretical framework/Conceptual model or method

In chapter 3 you will present the current and proposed theory and derived models or methods that are directly relevant to your research problem. The theory should be embodied in conceptual models (graphical, mathematical or schematic descriptions or analogies) or practical methods (procedures or techniques).

For a theory-testing or -application study, you will present the models or methods you wish to test or apply. The relevant current theories should be extracted from Chapter 2, integrated and presented again in summarised form.

For a theory-building study, you will use either deductive or inductive (retroductive) reasoning. When using deductive reasoning, the deduction of new theoretical propositions must be substantiated by references to real-world observations (Chapter 1) and past scholarship (Chapter 2). You have to describe how you
developed your new or improved model or method based on the new theoretical proposition. You have to describe your model or method in detail and show that what you are proposing is new. Remember that applying a known model to a new application is also “new”.

Theories should be subjected to empirical testing to evaluate their validity. The deduction of research hypothesis (expectations based on theory) can serve as a useful methodological guide. When observational facts support a hypothesis, the probability of its being true is increased, but if any contradicting facts are uncovered, the hypothesis must be rejected. The hypotheses will also be useful when doing the research design. This is a powerful methodology for theory testing and should be used whenever appropriate. Hypotheses could be omitted when using only retroductive reasoning (see Appendix 1). This is often the case in surveys, case studies, exploratory, and application studies. Sub-headings for this chapter could be:

3.1 Theories, models or methods to be used for this study.
3.2 Hypotheses (optional).

Chapter 4: Research design and methodology

Chapter 4 should contain your discussion of the research design and methodology followed in your study in order to investigate the problem as formulated above. Once you have specified your theory, model or method, you have to show that it is valid (true) and/or useful. This you do by applying it to real-world case/s – this is the empirical testing or application phase. This is where working with hypotheses could be helpful, as they will determine the type of data required to test them. Describe the data-gathering and data-analysis techniques and instruments you intend using. See Mouton (2001:123) for detailed instructions on writing this chapter. Sub-headings for this chapter could be:

4.1 Research strategy
4.2 Research methodology
4.3 Research instruments

Chapter 5: Results: Data gathered and analysis

Chapter 5 should contain the presentation and discussion of the data or information collected and analysed in the study. This includes the testing of hypotheses by showing that the observed facts support the hypotheses or not. When using retroductive reasoning, this chapter will include the inference of new hypotheses based on the observed facts. See Mouton (2001:124) for detailed instructions on writing this chapter. Sub-headings for this chapter could be:

5.1 Data gathering process
5.2 Data or information gathered
5.3 Data analysis
5.4 Hypotheses testing
5.5 New hypotheses, theories, models or methods
Chapter 6: Conclusions and recommendations

In chapter 6 the main conclusions of the study are summarised, discussed and interpreted, and where appropriate recommendations are made for further research and practice or policy. You have to show that current theory or your proposed theory and derived models or methods are supported by the research. This is also where you could use retroductive reasoning to formulate new theory.

The most important conclusion is that you have achieved the stated objective: “To [apply/test/develop] theory/model/method for …”. You have to convince the reader that you have made an important and unique contribution to the “state-of-the-art”. An honest appraisal of what you have accomplished is however also appropriate. Without diminishing the value of what you have done, you should state any shortcomings and areas for further research. This should be contained in the recommendations. See Mouton (2001:124) for detailed instructions on writing this chapter. Sub-headings for this chapter could be:

6.1 Research results
6.2 Implications for and/or contributions to theory and practise
6.3 Self-assessment
6.4 Recommendations

List of references and appendices

List all the references by number in the order they were referenced. Adhere to the prescribed format (see Appendix 11: Referencing Method). See Mouton (2001:125) for detailed instructions on writing this part.

General Regulations G.58 and G.59 must be adhered to in the technical editing of the thesis/dissertation/report. Additional regulations that apply in the Department of Engineering and Technology Management are given in Appendix 14.

9. WRITING A RESEARCH ARTICLE FOR A SCIENTIFIC JOURNAL

It is a requirement of the Department of Engineering and Technology Management that all post-graduate students submit research articles for publication in scientific journals. The following are the main requirements that has to be adhered to:

9.1 Authors

The student and his/her study leader/s are the authors or the articles. The name of the individual who was the principle writer of the article (usually the student) should appear first when the names of the authors are given. The affiliation of the authors must be given. Students must give their affiliation as the Department of Engineering and Technology Management, University of Pretoria and not their employer’s name.
9.2 Accredited journals

Articles may only be submitted for publication in peer-reviewed scientific journals accredited by the South African Department of Higher Education and Training (DHET). The Department's List of Accredited Journals is compiled from journals included in ISI and IBSS, as well as South African journals selected by the Department for this purpose and listed under List of Approved South African Journals. Consult the lists of accredited journals acknowledged by DHET at http://www.ais.up.ac.za/journals/journalsaccredited.htm.

The following are some high-quality journals to consider for the publication of research articles:

<table>

9.3 Structure of a research article

Appendix 12 contains guidelines for the structure of a research article.

9.4 Journal's instructions to authors

Every journal has its own instructions to authors for the articles they will accept for publication. These covers matters such as technical layout (e.g., paper size, font, line spacing, margins, page numbering, format of figures, tables and references, etc.) and method of submission (e.g., number of copies, electronic submission, etc.) These instructions are given in every copy of the journal. Students should therefore obtain a copy of the journal and follow their instructions when writing the article. Unless otherwise advised by their study leaders, MEM and MPM student’s articles will be submitted to the South African Journal of Industrial Engineering. Appendix 12 contains this journal’s instructions to authors.

10. COLLOQUIUM, SYMPOSIUM AND CONFERENCE PRESENTATIONS

Key requirements of scientific research are that it must be public and reproducible (by others). Therefore, an exposure of how the scientific research is structured and executed is of crucial importance, so that others are able to agree or disagree that the observed and/or measured event/s have (or have not) occurred (Page & Meyer 2000:12). It is therefore expected of researchers to present their research at colloquia, symposia and conferences.

10.1 Colloquia presentations

The Department of Engineering and Technology Management organises colloquia on a regular basis to give students the opportunity to present their research to academics and fellow students. It also forms part of the Research Management Process described in Section 6 of this Guide. MOT and PhD students are required to make a colloquium presentation whenever a milestone has been reached. MBA/MEM/MPM students make only two colloquium presentations: the first at the beginning (project proposal); and the second on completion of their research projects. Students MUST submit their presentations to their study-leaders, who must approve that it complies with the requirements as set herein, before they do their colloquium presentations.

The purpose of a colloquium presentation is twofold: 1) to give a progress report on completed work, and 2) to present your planning for the continuation of the research project and discuss any problems you are experiencing. The relative
weight of the two parts will change as the project progresses - initially it will consist of only part 2), but after the completion of the project it will consist of only part 1).

The basic structure of a research presentation is the same as for a dissertation, thesis, research report or a research article. Typically, the presentation should start with the research problem, followed by the research methodology, the findings and the conclusions. Here are some guidelines (and examples of PowerPoint slides) for the structure of a research presentation at a colloquium:

**Topic and author/s**

The presentation should start with the title of the presentation and name/s and field of study of the author/s.

**Current status/progress to date**

Give the current status of the project by presenting the progress to date in terms of the schedules of milestones (See Appendix 6).

**Introduction**

Present the background information regarding the technological, industrial and organisational setting of the study. Give the reasons for selecting the particular problem, as well as a statement of the research problem and/or research objectives and/or research question/s.
Theoretical framework

Present a (short) review of the relevant scientific literature. Describe the current theories, models and methods that are relevant to the research problem. For a theory, model or method-building study, the deduction of new theoretical propositions, models or methods should be presented, as well as any research hypotheses.

Research Methodology

Describe the research strategy/design and methodology followed in the study, including the methods used for data collection and analysis. Discuss the testing of hypotheses and the derivation of new theoretical propositions, models or methods when using retroductive reasoning.

Conclusion

The main conclusions of the study should be summarised, interpreted and discussed. Where appropriate, recommendations should be made for further research or practice or policy.

10.2 Symposium and conference presentations

Students are encouraged to present their research at local and overseas symposia and conferences. Conference organisers usually require presenters to submit a paper (or an abstract) for publication in the proceedings. They have their own unique prescriptions for the format of the papers they will accept for publication. The guidelines for writing conference papers are the same as for journal articles (see Appendix 12).
The basic structure of a conference presentation is the same as for a colloquium presentation, but would normally deal only with completed research.

10.3 Presenting skills

Presenters should prepare thoroughly for their presentations. Time utilisation is of the utmost importance as the time allowed is usually very limited and some time should also be allowed for questions and discussions. Typically speakers have 15 to 20 minutes for presentations at colloquia, symposia and conferences. Audio-visual aids should be used to best effect. The use of MS PowerPoint presentations have become the standard, but the use of posters, transparencies and flip-charts are acceptable.

The following are useful guidelines to presenters:

- Speak to the audience and not to the screen. Never turn your back to the audience. Have written notes or read from the computer display in front of you, but don't turn around to read what's on the screen.
- Project your voice by speaking to the furthest person in the hall and not to those closest to you.
- Don't read only what's on the screen or expect of the audience to do so. (If that is your intention, then why do the presentation? Just hand them a hard copy to read!). The purpose of the images on the screen is to provide the audience with a visual reference to what you are saying. It also allows you to show graphical images such as photographs, diagrams, flow-charts, etc. It is also useful as "speaker's notes" to remind you what to say next.
- When pointing to something on the screen, use an aid such as the arrow cursor of the computer (this works well in PowerPoint) or a pen (when using transparencies) or a laser pointer or a rod to point on the screen. Don't stand in front of the projected image and point with your hands!
- Be very careful not to clutter the images with too much detail. Use large fonts (recommended are Ariel regular, 28 pt or larger for PowerPoint presentations.) and high contrast (dark colours on light background or vice versa).
- Practise presenting your presentation and time yourself. You will always take somewhat longer when you present it in front of an audience, so allow for this. A good rule-of-thumb is that you cannot get through more than one slide per minute at most! More complicated slides like diagrams that need a lot of explaining will take much longer.
- Pay attention to voice intonation (do not speak in a monotonic way) and non-verbal communication (body language; do not stand as a salt pillar, do not jump around).
APPENDIX 1: GLOSSARY OF RESEARCH TERMS

Assumption
A fact or statement taken for granted (assuming it to be true).

Axiom
A statement accepted as true or a self-evident truth.

Concept
Abstract or generic idea generalized from particular instances.

Conceptual
Relating to, or consisting of concepts.

Conjecture
A proposition before it has been proved or disproved.

Empirical
Originating in or based on observation or experience.

Fiction
A fiction is either a deliberate or an unintentional fantasy, which is not based on reality. Sometimes a false assumption (fiction) can be introduced deliberately for the purpose of clarifying a scientific problem methodologically. (Gitt, 1997)

Hypothesis
A tentative assumption made in order to draw out and test its logical or empirical consequences. A hypothesis is an unverified scientific conjecture which contains speculations, and which amplifies an incomplete empirical result, or provisionally explains some fact. If a hypothesis serves as a methodological guide when a new research project is undertaken, it is known as a research hypothesis. When observational facts support a hypothesis, the probability of its being true is increased, but if ONE contradicting fact is uncovered, the hypothesis must be rejected (falsification). (Gitt, 1997)

A hypothesis is usually stated as a testable expectation, logically derived from a proposition, theory or observation.

Method
A way, technique, or process of or for doing something.

Methodological
Relating to method.

Methodological study
Study aimed at developing a new method, process or technique.

Model
A graphical, mathematical or schematic description or analogy of a system of postulates, data, and inferences. Models are representations of reality. Only the
most important properties are reflected, and minor or unrecognised aspects are not covered. Models are important because of their illustrativeness. A model is a deliberate but simplified representation of reality and it describes observed structures in a readily understandable way. It is possible to have more than one model for a given reality, and, because it is by nature provisional and simple, any model can always be improved upon. (Gitt, 1997)

**Model-building study**

Study aimed at developing a new model and theory to explain a particular phenomena. (Mouton 2001:176 - 178.)

**Notion**

Conception or impression of something known, experienced, or imagined

**Paradigm**

When a certain theory (or a system of hypotheses, or a world-view) pervades entire fields of research or an entire scientific era, it is known as a paradigm. Such a view then dictates the scope for specific researches and delineates the presuppositions used for explaining individual phenomena. If a system of hypotheses has been derived from presuppositions dictated by a world-view, it usually cannot be reconciled with the available facts. (Gitt, 1997)

**Postulate**

To claim as true, existent, or necessary

**Proposition**

Something offered for consideration or acceptance usually stated in sentence form near the outset

**Research**

Investigation or experimentation aimed at the discovery and interpretation of facts, revision of accepted theories or laws in the light of new facts, or practical application of such new or revised theories or laws. (Merriam-Webster Collegiate Dictionary)

Research is original investigation undertaken to gain knowledge and/or enhance understanding. Research specifically includes the creation and development of the intellectual infrastructure of subjects and disciplines (e.g. through dictionaries, scholarly editions, catalogues and contributions to major research databases); the invention or generation of ideas, images, performances and artefacts where these manifestly embody new or substantially developed insights; the use of existing knowledge to produce new or substantially improved materials, devices, products, policies or processes. It specifically excludes routine testing and analysis of materials, components, instruments and processes, as distinct from the development of new analytical techniques; the development of teaching materials and teaching practices that do not embody substantial original enquiry. (National Research Foundation)

**Speculation**
When a statement is based purely on discussion, fantasy, imagination, or contemplation, and does not correspond to reality, it is speculation, or merely an intellectual game. Because no actual experimentation is involved, it is easy to make undiscoverable mistakes. In thought experiments difficulties can easily be evaded, undesirable aspects can be suppressed, and contradictions can be deftly concealed. Thought experiments can probably raise questions, but cannot answer any; only actual experimentation can provide answers. Mere speculation without experimentation and observation is not science, neither is pure deduction from arbitrary presuppositions, nor is a biased selection of observations. Even the most abstract theory should not lose contact with reality and experimentation; it must be empirically verifiable. Thought experiments as well as deductions from philosophical postulates not based on observation, are speculations. (Gitt, 1997)

**Supposition**
Something that is supposed to be true.

**Theory**
A plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. Theories endeavour to explain facts in a unified representation of models and hypotheses. To put it briefly, a theory is a scientific statement based on empirical findings. Since empirical results are seldom final, theories are of a provisional nature, and the inherent hypothetical element inevitably causes uncertainty - in the best case a statement can be made in terms of specific probabilities. Theories are therefore a means of tying observed facts together, and the best theories are those, which attain this objective with the least number of inconsistencies. (Gitt, 1997)

**Theorem**
An idea, proposition, or statement accepted or proposed as a demonstrable truth often as a part of a general theory

**Verification**
Verification means that a statement is tested experimentally. The result of such verification is not generally valid, however. It holds strictly only for cases that have actually been confirmed, because the possibility that hitherto unknown counter examples may exist cannot be excluded. If one contradictory case is found, then the statement is rejected (falsified!). This can also be expressed as follows: It is not possible to verify a theory; a theory can only be falsified. A theory is good if it could be falsified very easily, and when it survives all open criticisms and tests, it can be accepted. (Gitt, 1997)
APPENDIX 2: SUBJECTS IN ENGINEERING AND TECHNOLOGY MANAGEMENT

Decision Analysis
Development Management
Engineering Economics
Engineering Logistics
Engineering Management
Entrepreneurship
Financial Management
General Management
Information Management
Innovation Management
- Understanding the Dynamics of Technological Change (Substitution, Diffusion, Products and Processes Evolution, Performance Trajectories)
- Assessment of Technological Threats and Opportunities (Emerging Technologies Assessment, Technology Forecasting, Technological Landscape Scanning and Monitoring, Competitive Intelligence)
- Impact Assessment of Technologies
- Innovation Strategies and Methodologies
- Appropriate Technology and Appropriate Best Practice
- Technology Audits
- Technology Transfer Mechanisms
- Adoption, Uptake and Diffusion of Technology
- Incubation of Technology-based Companies (SMMEs)
- National Innovation System and Policy
- National Technology Policy Initiatives
- Impact of Technology on Competitiveness and Quality of Life

Law of Contract
Maintenance Management
Marketing Management
New Ventures & Entrepreneurship
Operations Management
People Management
Production and Operations Management
Project Contract Management
Project Cost Management
Project Financial Management
Project Human Resource Management
Project Management
Project Quality Management
Project Risk Management
Project Systems Engineering
Quality Management
R&D Management
Safety, Health & Environment Management
Strategic Management
Systems Engineering
Technology Management
APPENDIX 3: SUBJECT LITERATURE FOR ENGINEERING AND TECHNOLOGY MANAGEMENT

Textbooks
Textbooks prescribed and recommended by the lecturers in the Engineering and Technology Management programmes.

Journals
Search the UP Library Catalogue at http://www.ais.up.ac.za/.

## APPENDIX 4: RESEARCH FLOWCHART

### PHASE 1: RESEARCH PROPOSAL

**Actions:**
- Initiating problem or assignment (Research idea)
- First environmental scanning
- First theory and research survey
- Definition of the research problem
- Propose title for dissertation/thesis/report
- Proposed research methodology
- Estimation of potential for success

**Output:** *Research Proposal Document*

**Baseline 1: Research Proposal Review**
- Approval of *Research Proposal* by Research Committee of Department
- Colloquium presentation

**Milestone 1: Research Proposal Approved**

### PHASE 2: RESEARCH PLAN

**Actions:**
- Comprehensive environmental scanning
- Comprehensive theory and past research survey and critical analysis
- Conceptual model/s, propositions and hypotheses
- Choice of research design
- Development of data-gathering techniques and instruments

**Output:** *Research Plan* consisting of:
- 1st Draft of Chapter I (Background, Research Question/s)
- 1st Draft of Chapter II (Theory and research review)
- 1st Draft of Chapter III (Conceptual Model [or Theory or Method])
- 1st Draft of Chapter IV (Research design and methodology)
- List of references and appendices

**Baseline 2: Research Plan Review**
- Approval of *Research Plan* by Research Committee of Department
- Approval of *Research and Instruments* (e.g. questionnaires) by Faculty Committee for Research Ethics and Integrity2
- Colloquium presentation

**Milestone 2: Research Plan Approved**

---

2 All research involving interaction with people must be submitted to the Ethics Committee of the Faculty for approval. The application form for approval is available on the faculty website at [http://www.up.ac.za/ebit/r_ethics.html](http://www.up.ac.za/ebit/r_ethics.html). See also Appendix 15.
### PHASE 3: RESEARCH EXECUTION

**Actions:**
- Execution of data-gathering
- Execution of analysis
- Model (or Theory or Method) building or testing

**Output:** *Research Report* consisting of:
- 2nd Draft of Chapter I
- 2nd Draft of Chapter II
- 2nd Draft of Chapter III
- 2nd Draft of Chapter IV
- 1st Draft of Chapter V (Results: Data gathered and analysis)
- List of references and appendices

**Baseline 3: Research Review**
- Approval of Research Report by Research Committee of Department
- Colloquium presentation

**Milestone 3: Research approved**

### PHASE 4: WRITING OF DISSERTATION/THESIS/REPORT

**Actions:**
- Finalise Chapters I to V
- Write Chapter VI with interpretation and findings
- Proof reading and compilation of draft dissertation/thesis/report
- Write article/s for peer-reviewed international journals

**Output:** *Draft dissertation/thesis/report*

**Baseline 4: Dissertation/thesis/report Review**
- Approval of draft dissertation/thesis/report by Research Committee of Department
- Approval of draft article/s for peer-reviewed international journals
- Colloquium presentation

**Milestone 4: Dissertation/thesis/report Approved**
PHASE 5: EXAMINATION AND DISSEMINATION OF RESEARCH RESULTS

**Actions:**
- Preparation, bind and distribute examination copies of dissertation/thesis/report
- Submit article/s to peer-reviewed international journals

**Output:**
- Dissertation/thesis/report
- Published article/s in peer-reviewed international journals
- Symposium or Conference presentation/s

**Baseline 5: Examination**
- Internal and external examination
PHASE 1: RESEARCH PROPOSAL
- Environmental scanning
- First literature survey
- Definition of research problem
- Proposed title for dissertation/thesis/report

START

PHASE 2: RESEARCH PLAN
- Comprehensive literature survey & critical analysis
- Research design

Milestone 1

Research Proposal

Milestone 2

Research Plan Review

Milestone 3

Research Review

Milestone 4

Diss./Thesis Report Review

PHASE 3: RESEARCH EXECUTION
- Data gathering
- Data analysis

PHASE 4: DISSERTATION/THESIS/REPORT
- Finalise Chapters I to V
- Update literature review
- Write Chapter VI & journal article/s

Milestone 5

Examination

FINISH

PHASE 5: EXAMINATION
- Prepare, bind and distribute copies of dissertation/thesis/report
- Submit journal article/s

Milestone 6

Submit

• Research proposal

• 1st draft of Chapters I, II, III and IV

• 2nd draft of Chapters I, II, III and IV

• 1st draft of Chapter V

• Draft Dissertation/thesis/report

• Draft journal article/s

• Dissertation/thesis/report

Submit

APPENDIX 5: NOTES ON THE RESEARCH PROCESS
(Adopted from Malan, Coetzee & Van Breda 1992, P. 37)

1 INITIATING PROBLEM OR ASSIGNMENT

1.1 Possible initiators for research
- To enlighten or confirm a current theory
- To resolve conflicting findings
- To correct faulty methodology or use of inappropriate techniques
- To solve existing practical problems

2 FIRST THEORY AND RESEARCH SURVEY

2.1 Functions of the Theory and Research Survey
- Recognition of the meaningful and relevant
- Gauging the quality of other research
- Raise a critical attitude
- Schooling in fine observation (also of traps)

2.2 Information Sources
- Primary and secondary sources
- Literature types
- Comprehension literature
- Research literature

2.3 Role of the Theory and Research Study
- Selection of research theme
- To define the boundaries of the terrain
- To delimit the scope of the research
- Choice of procedures, techniques and instruments
- To avoid unnecessary repetition
- To evaluate meaningfulness of own findings
- To formulate hypotheses sharper
- To do more purposeful research

2.4 Documentation Systems

2.5 Performing Source Studies
- Start with most recent work
- Start with recognised authors
- Start with articles, dissertations and theses
- Start with each source by first reading the abstract or summary to judge relevance

2.6 Make notes
- Bibliography cards
- Contents cards
- Numbering
3 DEFINITION OF RESEARCH PROBLEM

3.1 Precise demarcation of problem
- Proceeding from the initiating problem or assignment (Step 1) and in the light of the theory and research survey (Step 2), demarcate the problem precisely
- Give notional (concept) definitions
- Give functional or operational definitions

4 ESTIMATION OF POTENTIAL FOR SUCCESS

4.1 Considerations for the estimation of potential for success

4.1.1 Practicability
- Own capabilities and training
- Is the data available?
- Are there sufficient financial resources?
- Do you have the time?
- Do you have enough interest and perseverance?

4.1.2 Uniqueness
To ensure that a student does not duplicate the topic/title of his/her Dissertation/Thesis/Report, a search has to be carried out on the Research Report database of the National Research Foundation. To do the search, follow the instructions below:

Go to the Academic Information Service website: [http://www/ais/up.ac.za](http://www/ais/up.ac.za)
Select: Information Resources
Select: Databases
Select: H
Select: Human Sciences Research Council
Select: Research Projects

Use the following password and ID
ID: zup01 or zup 02 to zup 05
Password: up

Search the database to ensure that the intended topic/title is not a duplicate of previous or current research.

4.1.3 Scope

4.1.4 Actuality

4.1.5 Polyvalence (many values)

4.1.6 Return on effort
4.1.7 Integration with daily work

4.1.8 Decision to proceed, change planning or abandon theme.

5 SECOND THEORY AND RESEARCH SURVEY

6 CHOICE OF RESEARCH UNDERTAKING

6.1 Time orientation
- Past – Library research
- Present – Field research
- Future – Laboratory research

6.2 Depth of research
- Describe
- Compare (and if possible, predict)
- Evaluate (including diagnostics)

6.3 Degree of generalisation
- Basic research
- Applied research
- Commissioned research (including Contract Research)
- Action research

6.4 Research undertaking
- Testing investigation
- Instrumental-nomological investigation
- Descriptive investigation
- Explorative investigation
- Interpretive-theoretical investigation

7 HYPOTHESES

7.1 Definition, nature and purpose of hypotheses
- Preliminary solution
- Expectation
- Based on existing knowledge

7.2 Characteristics of a good hypothesis
- Compatible with previous research
- Reasonable explanation
- Terse
- In operational terms
- Testable within a reasonable time

7.3 Types of hypotheses
- Based on derivation
- Inductive hypothesis
• Deductive hypothesis
• Based on proposition
• Research hypothesis
• Unguided
• Directive
• Null hypothesis (statistical hypothesis)

8 CHOICE OF DATA-GATHERING TECHNIQUES
• Perusal
• Observation
• Questioning (consultation)
• Measurement

9 CHOICE (AND DEVELOPMENT) OF DATA-GATHERING INSTRUMENTS

9.1 Controlling if data-gathering techniques has the desirable attributes
• Reliability
• Validity
• Sensitivity
• Appropriateness
• Objectivity
• Feasibility
• Ethical acceptability

10 DEVELOPMENT OF PLAN OF ANALYSIS
• Choice of analytical techniques that are appropriate for type of research, inter-
  alia statistical techniques
• Clearing with computer personnel (if required)

11 DESIGN OF DATA-GATHERING PLAN
• Training of co-workers (fieldworkers)
• Experimental design
• Scheduling of key dates

12 CHOICE OF THE INVESTIGATION GROUP
• Sampling
• Singular random individual sampling
• Systematic sampling
• Stratified sampling
• Batch sampling

13 PRELIMINARY INVESTIGATION
• Trail run for data-gathering approach
• Opportunity to test data-gathering method
• Opportunity to test data-gathering instrument and to refine it
• Opportunity to test data-processing technique
• Opportunity to familiarise co-workers with the instrument
• Opportunity to familiarise co-workers with the analysis of the data
• Opportunity to make final choices regarding
• Approaches
• Techniques
• Instruments
• Opportunity to formulate hypotheses more precisely
• Opportunity to identify intervention variables and to eliminate/control them

14 EXECUTION OF DATA-GATHERING

14.1 Dual responsibility
• Towards the research
• Towards the research object/s
• Prior to data-gathering
• During data-gathering
• After data-gathering

14.2 Essential attributes of the data-gathering situation
• Standardisation
• Provision for the unforeseen
• Sufficient time

15 EXECUTION OF ANALYSES

16 REPORT WRITING

17 DISSEMINATION

</table>
### THEORY AND PAST RESEARCH REVIEW

**Requirements:**

- Adequate overview and critical analysis of the relevant literature.
- Sources properly referenced.
- Number of literature sources consulted: PhD - >20, MOT - >10, MEM/MPM/MBA - >5.
- Standard of literature sources (Textbooks, Journal Articles, etc.)
- Indication of what research has already been done on this topic or in this field.
- Main theories, models and methods that currently exist mentioned.
- Indication of whether a need exists for a new or improved theory and the key attributes of the desired theory and derived models or methods.

**Mark**

**Comments**

---

### PROBLEM STATEMENT AND RESEARCH OBJECTIVE/S

**Requirements:**

- *Problem statement:* One paragraph, clear, complete and formal.
- Indication of the importance of the problem.
- Clearly stated *research objective/s* – what will be achieved?
- Indication of type of *research:* theory building, theory testing, or theory application research.
- Preliminary descriptions of the research proposition/s and/or hypotheses.
- Indication of the limitations of the study and the assumptions on which the research will be based.

**Mark**

**Comments**

---

### EXPECTED CONTRIBUTIONS

**Requirements:**

- Description of the expected nature of the results.
- Indication of the expected contribution(s) towards scientific knowledge and other values of the research.
- Indication of who will benefit from

**Mark**

**Comments**
PROPOSED RESEARCH STRATEGY

Requirements:
- Proposed approach and strategy for performing the research.
- Proposed research design and methodology to be followed.
- Proposed research instrument/s (questionnaire, case study, interview) and methods of data collection and analysis.
- Justification of why the methods are proposed.
- Proposed project plan and schedule for performing the research.

PROPOSED TABLE OF CONTENTS OF THESIS/DISSERTATION/REPORT

Requirements:
- Proposed chapter plan and a preliminary outline of the chapter divisions.

CONCLUSION

Requirements:
- Concluding statement on the feasibility of completing the study as proposed.

REFERENCES AND BIBLIOGRAPHY

Requirements:
- Complete list of references.
- Referencing Method (See Research Guide for Post-Graduate Students.)
- Preliminary bibliography listing the most important and recent specialist literature that has been consulted.

PERSONAL INFORMATION

Requirements:
- Name and student number
- Postal address
- E-mail address
- Telephone number(s)
- Complete academic record(s) as well as work history.
- List of previous research output, e.g. research reports, masters dissertation, publications, articles, conference papers, etc.

</tbody>
</table>
### FIRST DRAFT OF CHAPTER III (CONCEPTUAL MODEL / THEORY / METHOD)

**Requirements:**

- Description of current theories in terms of conceptual models (graphical, mathematical or schematic descriptions or analogies) or practical methods (procedures or techniques).
- Deduction of new theoretical propositions, substantiated by references to real-world observations (Chapter 1) and past scholarship (Chapter 2). (Only for *theory-building deductive research*, see Appendix 10.)
- Development of new or improved models or methods based on the new theoretical proposition.
- Logical deduction of research hypothesis.
- Length of chapter

### FIRST DRAFT OF CHAPTER IV (RESEARCH DESIGN AND METHODOLOGY)

**Requirements:**

- Presentation of the Research Design (type of research, proposed research methodology) for empirical testing or application of theory.
- Choice of data-gathering and data-analysis techniques and instruments (Will the data be sufficient to scientifically test the research hypotheses?).
- Length of chapter
- Research approved by Faculty Committee for Research Ethics and Integrity?

### REFERENCES AND BIBLIOGRAPHY

**Requirements:**

- Complete list of references.
- Referencing Method (See DETM Research Guide for Post-Graduate Students.)
- Preliminary bibliography listing the most important and recent specialist literature that has been consulted.

Theory-building research

Deductive reasoning

Yes

Deduction of new theoretical propositions

Research hypotheses

Data gathering and analysis

Hypothesis testing

New theory, supported?

Yes  No

No  Yes

Retroductive reasoning

Description of current theory.

Data gathering and analysis

Inference of working hypotheses

Induction of new theory, model or method

Yes

No

Theory-testing or -application research

Description of current theory.

Data gathering and analysis

Hypothesis testing

Current theory supported?

No  Yes
APPENDIX 11: GSTM HARVARD REFERENCING METHOD

"Academic" (and "Scientific") writing requires that sources be acknowledged EXPLICITLY. References should be given whenever statements are made that originates from another person's work or publications, even if rephrased. If such references are omitted the impression is created that they are the writers own work, thus amounting to plagiarisma which can have serious consequences for your academic career and eventually for your professional career. Plagiarism is a serious offence. It is not acceptable to give a list of (unreferenced) sources at the end of the document. Material that was read but that is not specifically referred to, can be given in a bibliography.

Please ensure that all referencing in all research reports is according to the GSTM Harvard Referencing Method. There are two tools available which will assist you with the Referencing.

Endnote (has to be installed on your computer)

Should you wish to use the Endnote software to assist you with the Harvard Referencing Technique, you should download the software and install it on your computer from: http://www.endnote.co.za/ENX7UPSL10324. Complete the form and read the instructions carefully. In order to download the software (82 MB) you have to enter your library username and password. Note: you must use the “Harvard GSTM” style available from clickUP.

Refworks (cloud-based)

To access Refworks, go to http://0-www.refworks.com.innopac.up.ac.za. Register and create an account on Refworks, read the instructions carefully and download Write n Cite. When using refworks and endnote, select “GSTM Harvard” as your preferred Harvard referencing method.

For more information: http://www.library.up.ac.za/referencing/index.htm.

The following method is prescribed for references to source material(s).

1. REFERENCES USED IN THE TEXT

References in the text should be by author(s) (only surnames) with the date of publication, colon and page number in brackets, e.g.

Kash (1989:9) states that …
... were shown to be important issues (Tidd, Bessant & Pavitt 1997:21).

The second and following references to the same source only indicate the first author's surname, followed by et al, e.g.

Tidd et al (1997:37) recommend that...
When referring to one author quoted by another author, use the following format:

Abell (in Burgelman, Maidique & Wheelwright (2001:6)) stated that...
or
Abell, as quoted by Burgelman, Maidique & Wheelwright (2001:6) stated...

2. REFERENCES USED IN TABLES AND FIGURES

References to sources, which relate to information contained in a table or figure, must appear immediately below the table or figure (preceded by “Source(s):”). (Cf. Table 1 as an example.)

Table 1 – The gross domestic product of the Republic of South Africa, 1990 - 1993

<table>
<thead>
<tr>
<th>Year</th>
<th>Gross domestic product 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1990</td>
<td>247 315</td>
</tr>
<tr>
<td>1991</td>
<td>244 549</td>
</tr>
<tr>
<td>1992</td>
<td>238 711</td>
</tr>
<tr>
<td>1993</td>
<td>242 001 2)</td>
</tr>
</tbody>
</table>

1) Gross domestic product at constant 1990 prices.
2) Estimated value

3. FOOTNOTES

Footnotes can be used to clarify words or items in the text, figures or tables, but must NOT be used as a way of referencing. If any footnotes are required, Arabic numerals are used with one bracket as a superscript. Footnotes referring to words or figures in the text must appear at the bottom of the page. However, footnotes that relate to a table or figure must appear immediately below the table or figure. (Cf. Table 1 as an example.)

4. LIST OF REFERENCES

References must be provided at the end of the dissertation/thesis/report/article in the form of one consolidated and alphabetical list of all the sources referred to throughout the document.

The order of items in a reference is as follows:

Reference to a book

Author's Surname, Initials. Year of publication. Title. Edition (if not the first). Place of publication: Publisher.

Reference to a contribution in a book

Contributing author's Surname, Initials. Year of publication. Title of contribution. Followed by In: Initials. Surname, of author or editor of publication followed by ed. or eds. if relevant. Title of book. Place of publication: Publisher, Page number(s) of contribution.

Reference to an article in a journal

Author's Surname, Initials. Year of publication. Title of article. Title of journal, Volume number and (part number), Page numbers of contribution.

Reference to a conference paper

Contributing author's Surname, Initials. Year of publication. Title of contribution. Followed by In: Initials. Surname, of editor of proceedings (if applicable) followed by ed. Title of conference proceedings including date and place of conference. Place of publication: Publisher, Page numbers of contribution.

Reference to a dissertation/thesis

Reference to web pages/sites

Author's /Editor's Surname, Initials. Year. Title [online]. (Edition). Place of publication, Publisher (if ascertainable). Available from: URL [Accessed Date].

APPENDIX 12: GUIDELINES FOR WRITING A JOURNAL ARTICLE

Journals have their own unique prescriptions for the format of the articles they will accept for publication. The technical layout must be as prescribed by the journal. Unless otherwise advised by their study leaders, MEM and MPM student’s articles will be submitted to the South African Journal of Industrial Engineering. This journal’s instructions to authors are given at the end of this appendix.

The basic structure of a research article is the same as for a dissertation, thesis or research report. Typically, the article should start with the research problem, followed by the research design, the empirical evidence and the conclusions. Here are some guidelines for the structure of a research article:

**Preliminaries**

The article should start with the title, names and affiliations of the authors, and an abstract.

**Part 1: Background**

Part 1 should contain background information regarding the technological, industrial and organisational setting of the study. It should present the reasons for selecting the particular problem - the rationale for the study - as well as a statement of the research problem and/or research objectives and/or research question/s. Sub-headings for this part could be:

1.1 Introduction
1.2 Historical development and current state of the industry, organisation/s and technology under investigation
1.3 Research problem
1.4 Research objectives and/or research question/s

**Part 2: Theoretical framework**

Part 2 should contain a review of the most authoritative scholarship on the research problem. The referencing method must be as prescribed by the journal. Current theories, conceptual models (graphical, mathematical or schematic descriptions or analogies) and practical methods (procedures or techniques) should be described and it should be indicated if any of them can or have been applied to the research problem. Figures and tables must be as prescribed by the journal. For a theory, model or method -building study, the deduction of new theoretical propositions, models or methods should be presented, as well as any research hypothesis. Sub-headings for this part could be:

2.1 Theory and research review
2.2 Theories, models and/or methods
2.3 Hypotheses

**Part 3: Methodology**
Part 3 should contain a discussion of the research design and methodology followed in the study, including the presentation and discussion of the data or information collected and analysed in the study. This includes the testing of hypotheses and the derivation of new theoretical propositions, models or methods when using retroductive reasoning. Sub-headings for this part could be:

3.1 Research strategy/plan
3.2 Research instruments (e.g., survey questionnaires)
3.3 Data collection
3.4 Data analysis
3.5 Hypotheses testing
3.6 New hypotheses, theories, models or methods

**Part 4: Conclusions**

In part 4 the main conclusions of the study are summarised, discussed and interpreted, and where appropriate recommendations are made for further research or practice or policy. Indicate the contribution to the “state-of-the-art” that the research has made. An honest appraisal of what has been accomplished is also appropriate. Sub-headings for this part could be:

4.1 Research results
4.2 Implications for and/or contributions to theories, models or methods and practise
4.3 Recommendations

**List of references and appendices**
INSTRUCTIONS TO AUTHORS

All papers will be refereed and may be submitted in English or in Afrikaans.

Manuscripts must be submitted in duplicate to the editor. If accepted, manuscripts modified according to the referee's recommendations must be supplied printed camera ready. This copy should be accompanied by an IBM PC-compatible diskette containing the manuscript file in Word Perfect or MS-Word. Authors are required to conform to the instructions and format below.

The Times New Roman font at 12 point size, single spacing should be used. A page margin of 25mm along the sides and 30 mm at the top and bottom should be used on A4 paper. Do not number pages.

The Title Page should conform to the following centred format. The text of the paper should only start on the next page.

<table>
<thead>
<tr>
<th>TITLE OF THE PAPER IN UPPER CASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of author(s)</td>
</tr>
<tr>
<td>Affiliation of author(s) and contact information</td>
</tr>
</tbody>
</table>

ABSTRACT
An abstract in English, of no more than 100 words should appear here. It should not include any mathematical symbols.

OPSOMMING
'n Opsomming in Afrikaans van nie meer as 100 woorde moet hier verskyn. Dit mag nie enige wiskundige simbole bevat nie.

The Text of the paper should conform to the following format.

Figures and tables should form an integral part of the paper, according to the author's preferences and should be numbered consecutively in Arabic numerals (Figure 1).

Use full justification.

References in the text should be by author and the reference number in square brackets e.g. Li[1], and the detail should appear at the end of the text as follows:

REFERENCES
APPENDIX 13: GUIDELINES ON AVOIDING PLAGIARISM

UNIVERSITY OF PRETORIA
AVOIDING PLAGIARISM: A GUIDE FOR STUDENTS

What is plagiarism?

You commit plagiarism when in any written work you use another person’s words, ideas or opinions without acknowledging them as being from that other person. You do this when you copy the work word-by-word (verbatim); or submit someone else’s work in a slightly altered form (such as changing a word with one meaning to another word with the same meaning); and you do not acknowledge the borrowing in a way that shows from whom or where you took the words, ideas or reasoning.

You must provide references whenever you quote (use the exact words), paraphrase (use the ideas of another person, in your own words) or summarise (use the main points of another’s opinions theories or data.)

It does not matter how much of the other person’s work you use (whether it is one sentence or a whole section), or whether you do it unintentionally or on purpose. If you present the work as you own without acknowledging that person, you are committing theft. Because of this, plagiarism is regarded as a very serious contravention of the University’s rules which can lead to expulsion from the University.

Even if another student gives you permission to use one of his or her past assignments or other research to hand in as you own, you are not allowed to do it. It is another form of plagiarism. You are also not allowed to let anybody copy your work with the intention of passing it off as his/her work.

While academic staff must teach you about systems of referencing, and how to avoid plagiarising, you too need to take responsibility for your own academic career. Speak to your lecturer if you are at any stage uncertain as to what is required.

Information brochures on this topic are also available at the Academic Information Services.
APPENDIX 14: TECHNICAL EDITING

1. Language and General Requirements

The thesis/dissertation/report must be in either English or Afrikaans. The final thesis/dissertation/report copy must have a ready-for-publication appearance. It must have standardised features and be attractively reproduced. Introductory material, text, and appendices must all be clearly and consistently prepared and must all meet the specifications stated below.

2. Paper size and Layout

Only good quality A4-size (210mm x 297mm) white paper must be used. Manuscripts must be typed in only one column to the page. Use one side only. All text pages must be laid out in "portrait" orientation. As an exception pages containing only an exhibit (table or figure) may be in "landscape" orientation, if so required.

Top, bottom, and right margins must be 25mm. The left margin must be 30mm, to allow for binding.

3. Fonts, Point Sizes, Spacing and Equipment.

Text should be printed in Arial, Times Roman or similar fonts with point size not less than 10 and not more than 12 (used in this document). An exception to this are the chapter headings, which should be in 14 point. One and a half spacing should be used (as shown in this paragraph), except where conventional usage calls for single spacing; e.g. footnotes, indented quotations, tables, etc.

A letter quality printer (laser, impact, or ink jet) or an electric typewriter is required for printing the final manuscript.

Headings should be bold if possible, otherwise underlined (but not both). Book and journal titles should be italicised if possible, otherwise underlined. Text should be left and right justified against the margins (as shown in this document). Text must not be indented under headings.
5. **Corrections.**

No corrections with correction fluid or any other method are allowed on the manuscript. Use black ink whenever it is necessary to letter mathematical symbols or other copy by hand.

6. **Tables and Figures.**

Tables and figures are exhibits and numbered sequentially. They should be placed as close after their first mention as possible. The table number or figure number as well as heading of each exhibit must appear centred directly beneath the exhibit as in the following example:

![Influence Diagram of Test Problem](image)

**Figure 7: Influence Diagram of Test Problem**

Although placement of exhibits directly in the text is preferred, it is also acceptable to place exhibits on separate pages, immediately following the page of first mention. Line drawings and photographs should be reduced to proper size. Ensure that all text, symbols and information in exhibits are clearly legible in the final manuscript. Avoid text or symbols smaller than 10 points.

7. **Equation Numbers, Symbols and Abbreviations.**

When numbering equations, enclose numbers in parentheses and place flush with right-hand margin of the column. Equations themselves should be centred. See sample below. Use only standard symbols and abbreviations in text and exhibits.

\[
\sigma_X^2 = \frac{1}{n} \left\{ \sum_{i=1}^{n} X_i^2 - n \bar{X}^2 \right\}
\]  

(12)
8. **Headings**

The thesis/dissertation/report must be divided into chapters, and further into paragraphs and subparagraphs (if so required). Do not use more than 4 levels of indenture. Each chapter must start on a new page. A blank line should be used to separate headings from text above and below them. Blank lines must be used to separate paragraphs. New paragraphs are not indented, but start flush with the margin. In the event of a subparagraph that is numbered but does not require a heading, the text should start immediately next to the number and not on the next line.

9. **Word and Text Divisions**

Words must be divided correctly at the end of a line and may not be divided from one page to the next. Use a standard dictionary to determine word division. If word-processing is used, it must divide words and text correctly: you may find it advisable to avoid all word division. Avoid short lines that end a paragraph at the top of a page, and any heading or subheading at the bottom of a page that is not followed by text.

10. **References**

List all references by number at the end of the thesis/dissertation/report in alphabetical order, as shown below. Text references should use the author's name, date of publication and page number. For example, "According to Smith (1991:8) ....." or "The use of influence diagrams (Howard and Matheson 1984:22) .....".

11. **Order and Content**

This paragraph describes the required order and content of the thesis/dissertation/report.

**11.1 Preliminary Pages**

a. Title page - a sample page is attached. Follow the format exactly; use upper case letters as shown. The title of the thesis/dissertation/report should be a meaningful description of the content of the manuscript. Use word substitutes for formulas, Greek letters, etc. Avoid long titles.
b. Abstracts - one in English and one in Afrikaans (starting on separate pages), according to the format attached. In the case of an English thesis/dissertation/report, the English abstract should be placed first and for an Afrikaans thesis/dissertation/report, the Afrikaans one. The abstract should be carefully prepared to give a succinct account of the research. It should include a statement of the problem, procedure and methods, results and conclusions. The abstract must follow the style used for the rest of the manuscript.

c. Acknowledgements, if any.

d. Table of Contents, with page references.

e. List of Tables, with titles and page references.

f. List of Illustrations, with titles and page references.

11.2 Text

a. Introduction

b. Main body

11.3 References

a. Bibliography or list of references.

11.4 Appendices

12. Pagination

Each page of the manuscript, including all blank pages, and pages with tables, figures, computer program printouts should be assigned a number. Consistent placement of pagination (preferably centre at the bottom of the page), at least 12mm from the paper's edge, should be used throughout the manuscript. The following pagination plan must be used:

- For the preliminary pages, use small Roman numerals (i, ii, iii, iv, etc.). The title page does not have a number but counts as page i; the following page is ii.

- For the remainder of the manuscript - continuous pagination for text, illustrations, references and appendices - use Arabic numbers (1, 2, 3, etc.)
13. Reproduction and Binding

Final copies of the thesis/dissertation/report must be clear and attractive. Review each copy for evenness and clarity of type, missing pages and crooked text. The final copies must be photocopied to produce consistent print quality without grey or dark casts to the background.

Four bound copies as well as one loose-leaf copy (i.e. not bound in any way) must be handed in after final approval by your research adviser. The quality of the loose-leaf copy must be sufficient to allow microfilming and photocopying. The thesis/dissertation/report must be bound with a hard cover, on which the title of the thesis/dissertation/report as well as your name must be printed in gold capital lettering. Your name as well as the year of submission only must be printed on the spine, using the same lettering.

'n Afrikaanse samevatting moet in alle proefskrif/verhandeling/verslagte ingebind word. Die samevatting mag nie meer as 350 woorde wees nie.
APPLICATION FOR APPROVAL OF A RESEARCH PROJECT

This application form must be read with the UP Code of Ethics for Research, Regulations for Research Ethics and Integrity and the application for Engineering and Technology Management Research Studies as approved by the Faculty Committee for Research Ethics and Integrity on 18 April 2006.

1. Applicant's name …………………………………………………………………………………

2. Title of research project
   ………………………………………………………………………………………………………
   ………………………………………………………………………………………………………

3. Brief description of research project
   ………………………………………………………………………………………………………
   ………………………………………………………………………………………………………
   ………………………………………………………………………………………………………

DECLARATION

Hereby I declare that

1. I am acquainted with the Code of Ethics for Research and subscribe to and will apply the principles contained in this Code in all my research activities.
2. I am aware of the Regulations concerning the rules of the Faculty Committee for Research Ethics and Integrity and honour these.
3. My research study will fully comply with the descriptions of Engineering and Technology Management Research Studies as approved.
4. Research subjects will be informed, information will be handled confidentially, research subjects reserve the right to choose whether to participate and, where applicable, written permission will be obtained for the execution of the project (example of permission attached).
5. No conflict of interests or financial benefit, whether for the researcher, company or organisation, that could materially affect the outcome of the investigation or jeopardise the name of the university is foreseen.
6. Inspection of any experiments in loco may take place at any time by the Faculty Committee for Research Ethics and Integrity or its proxy.
7. The information I furnish in this application is correct to the best of my knowledge and that I will abide by the stipulations of the Faculty Committee for Research Ethics as contained in the regulations.

Signed: ……………………………………………… Date: ………………………
